CONTENTS

NUMERICAL METHODS II – ROOTS AND EQUATION SYSTEMS

Preface 6
Some mathematical symbols 12

1. ROOT-FINDING METHODS **13**

1.1 Classification of root finding methods 15
1.2 Open root-finding methods 19
1.2.1 Fixed point iteration 21
1.2.2 Newton's method 22
1.2.3 Halley's method 25
1.2.4 Householder's methods 28
1.2.5 Secant method 30
1.2.6 Steffensen's method 35
1.2.7 Müller's method 36
1.2.8 Inverse quadratic interpolation 39
1.2.9 Modified secant method 42
1.3 Bracketing root-finding methods 45
1.3.1 Bisection method 47
1.3.2 Dekker's method 51
1.3.3 Brent's method 55
1.3.4 False position method 57
1.3.5 Ridder's method 60
1.3.6 Modified false position method 63
1.3.7 Illinois algorithm 65
1.4 Newton-Raphson division 69

1.5 Square-root methods 74
1.5.1 Babylonian/Heron method 74
1.5.2 Square root by Halley's method 78
1.5.3 Square root by the 3rd order Householder's method 80
1.6 Inverse square-root methods 81
1.6.1 Inverse square root by Newton's method 81
1.6.2 Inverse square root by Halley's method 81
1.6.3 Inverse square root by the 3rd order Householder's method ... 82
1.7 N^{th} root algorithms 82
1.7.1 N^{th} root by Newton's method 82
1.7.2 N^{th} root by Halley's method 83
1.8 Roots in multidimensional domain 84
1.8.1 Multidimensional fixed-point iteration 87
1.8.2 Multidimensional Newton's method 88
1.8.3 Multidimensional Gauss-Newton method 91

2. LINEAR EQUATION SYSTEMS 93

2.1 Basic definitions and rules 94
2.1.1 Solution of a linear equation system 95
2.1.2 Inverse matrix 97
2.1.3 Determinant 100
2.1.4 Eigenvalues and Eigenvectors 103
2.2 Crammer's rule 104
2.3 Gaussian elimination 105
2.3.1 Gaussian elimination without pivoting 106
2.3.2 Pivoting 111
2.3.3 Gaussian elimination with row pivoting 112
2.3.4 Matrix inversion with Gaussian elimination 118
2.3.5 Determinant by Gaussian elimination 121
2.4 Gauss-Jordan elimination 125
2.4.1 Matrix inversion with Gauss-Jordan elimination 127
2.5 Crout reduction 129
2.6 Sequential substitution 133
2.6.1 Simple procedure 135
2.6.2 Two-phase procedure 137
2.6.3 Sparing a computer memory 138
2.6.4 Matrix inversion 140
2.6.5 Additibility and reversibility 140
2.6.6 Application 140
2.7 LU decomposition 141
2.7.1 Crout LU decomposition 142
2.7.2 Solving linear equation systems with LU decomposition 144
2.7.3 Matrix inversion with LU decomposition 146

2.7.4 Cholesky decomposition 148
2.8 Least squares 153
2.9 Iterative methods 154
2.9.1 Jacobi method 154
2.9.2 Gauss-Seidel method 155

3. SEQUENTIAL ELIMINATION METHOD 157

3.1 SEM without pivoting 159
3.1.1 Elimination formulas 163
3.1.2 Flowcharts 167
3.1.3 Number of numerical operations 170
3.1.4 Required memory 171
3.1.5 Programming SEM 176
3.1.6 Using computer programs 184
3.2 SEM with row pivoting 189
3.2.1 Flowcharts with row pivoting 198
3.2.2 Programming SEM with row pivoting 200
3.2.3 Using computer programs 209
3.3 Determinant with SEM 209

4. IMPROVED SEQUENTIAL SUBSTITUTION 211

4.1 First phase, adding equation coefficients 213
4.2 Second phase, elimination 215
4.3 Memory requirements 219
4.4 Back substitution 220
4.5 Computer program 221
4.5.1 Memory organisation 224
4.5.2 Manipulation with indexes 227
4.5.3 Manipulation with columns and rows 232
4.5.4 First phase, adding equation coefficients 237
4.5.5 Second phase, elimination 240
4.5.6 Closing equation 241
4.5.7 Removing equation 244
4.5.8 Preparing the solution 244
4.5.9 Setting known variables 245
4.5.10 Getting unknown variables 247
4.6 Pivoting 247
